Joint Symposium 6
Neuroimaging Committee / European Academy of Neurology (EAN)
Wednesday, September 13, 08:00 – 09:30

Session Title
Progress in Multimodal Imaging of Parkinson's Disease

Chairpersons
Henryk Barthel (Leipzig, Germany)
Nicola Pavese (Newcastle, UK)

Programme
08:00 - 08:30 Elsmarieke van de Giessen (Amsterdam, Netherlands): Novel MR Techniques to Image Parkinson's Disease
08:30 - 09:00 Rezzak Yilmaz (Ankara, Türkiye): Transcranial Sonography to Image Parkinson's Disease
09:00 - 09:30 Susanna Jakobsen Mo (Umeå, Sweden): Novel PET Tracers to Image Parkinson's Disease

Educational Objectives
1. Understand the need for imaging in Parkinson’s disease
2. Get an overview on the different imaging novelties currently developed to improve Parkinson’s disease diagnosis
3. Discuss the Pros & Cons of the different novel Parkinson’s disease imaging techniques

Summary
Parkinson’s disease is one of the most prevalent neurodegenerative disorders. Imaging-based diagnosis is considered as very helpful especially for early disease detection and differential diagnosis. In this context, novel MR imaging techniques, transcranial sonography and novel PET imaging tracers are currently evaluated. In this symposium, these promising tools will be discussed.

Key Words
Parkinson, MRI, sonography, dopamine, PET
